ARI ID: OB99

Dear Ms. Pinza:

Please find enclosed the original Chain-of-Custody (COC) record, sample receipt documentation, and the final results for the project referenced above. Analytical Resources, Inc. (ARI) accepted fourteen sediment samples in good condition on December 2, 2008. For further details regarding sample receipt please refer to the enclosed Cooler Receipt Form.

The samples were analyzed for TOC and Grainsize, as requested on the COC. Please note that details regarding the Grainsize analysis can be found in a laboratory-specific Case Narrative at the end of this report.

There were no anomalies associated with the analyses of these samples.

An electronic copy of this report and all supporting raw data will remain on file with ARI. Should you have any questions or problems, please feel free to contact me at your convenience.

Respectfully,
ANALYTICAL RESOURCES, INC.

Limits of Liability: ARI will perform all requested services in accordance with appropriate methodology following ARI Standard Operating Procedures and the ARI Quality Assurance Program. This program meets standards for the industry. The total liability of ARI, its officers, agents, employees, or successors, arising out of or in connection with the requested services, shall not exceed the invoiced amount for said services. The acceptance by the client of a proposal for services by ARI release ARI from any liability in excess thereof, not withstanding any provision to the contrary in any contract, purchase order or co-signed agreement between ARI and the Client.

Sample Retention Policy: All samples submitted to ARI will be appropriately discarded no sooner than 90 days after receipt or 60 days after submission of hardcopy data, whichever is longer, unless alternate retention schedules have been established by work-order or contract.

Case Narrative

1. Fourteen samples were submitted for grain size analysis according to PSEP methodology.
2. The samples were run in a single batch, and one sample from this job, REF-05, was chosen for triplicate analysis. The triplicate data is reported on the QA summary.
3. Some samples contained shells and/or fragments of shells.
4. Some samples contained organic material which may have broken down during the sieving process, skewing the grain size data.
5. The data is provided in summary tables and plots.
6. There were no other noted anomalies in this project.

Notes to the Testing:

1. Organic matter was not removed prior to testing, thus the reported values are the "apparent" grain size distribution. See narrative for discussion of the testing.

Notes to the Testing:

- Organic matter was not removed prior to testing, thus the reported values are the "apparent" grain size distribution. See narrative for discussion of the testing.

QA/QC SUMMARY

PROJECT:	NewFields Juneau		
PARAMETER:	Methyl Mercury		
LABORATORY:	Battelle Sequim		
MATRIX:	Sediment		
SAMPLE CUSTODY:	A total of fourteen sediment samples were received as outlined in the table below. The samples were analyzed within 3 days of receipt. The samples were assigned a central file number (2974) and entered into Battelle's sample log-in system. All samples were received at a temperature within the optimal temperature range for unpreserved samples (4±2°C).		
Sample Receipt Date	Number of Samples	Cooler Temperature	Comments
12/1/08	12	3.8°C, 4.6°C	none
12/2/08	2	acceptable	Temp not taken, but plenty of well frozen blue ice was present in the cooler

QA/QC DATA QUALITY OBJECTIVES:

	Reference Method	Range of Recovery	SRM/OPR Accuracy	Relative Precision	Achieved Detection Limit
Methyl Hg	EPA 1630 mod CVAF	65-135%	66-123 %	≤35%	0.0275 ng/g

METHOD: Fourteen wet samples were analyzed for methyl mercury by a modification of EPA Method 1630 (Methyl Mercury in Water by Distillation, Aqueous Ethylation, Purge and Trap, and CVAFS) coupled with the extraction method of Bloom, et al, 1997. Samples were collected on 11/17/08. Samples were analyzed on 12/4/08. No holding time has been established for MeHg in sediments. All samples were stored frozen until analysis. Samples were analyzed on a wet weight basis and results were converted to a dry weight basis using % dry weight values determined by oven drying the samples at 103-105°C until constant weight is achieved.

BLANKS: Three method blanks were analyzed with each analytical batch of samples. MeHg was not detected in any of the blanks at a concentration greater than the achieved the detection limit. None of the data were blank corrected.

MATRIX SPIKES: Two matrix spike/matrix spike duplicate pairs were analyzed for MeHg. All recoveries were within the criteria limits specified above. The RPDs on the MS/MSD pairs were within the method acceptance criteria for precision.

REPLICATES: One sample was analyzed in duplicate for MeHg. Precision is reported

QA/QC SUMMARY

by calculating the relative standard deviation (RSD) of replicate results. The RSD was within the method acceptance criteria limits listed above.

SRM: Two samples of the standard reference material IAEA-405 were analyzed with the batch of samples for MeHg. The recovery was within the criteria limits listed above.

ANALYTICAL NOTES: None

QA/QC SUMMARY

PROJECT:	NewFields Juneau		
PARAMETER:	Total Mercury		
LABORATORY:	Battelle Sequim		
MATRIX:	Sediment		
SAMPLE CUSTODY:	A total of fourteen sediment samples were received as outlined in the table below. The samples were analyzed within 1 day of receipt. The samples were assigned a central file number (2974) and entered into Battelle's sample log-in system. All samples were received at a temperature within the optimal temperature range for unpreserved samples (4±2°C).		
Sample Receipt Date	Number of Samples	Cooler Temperature	Comments
12/1/08	12	3.8°C, 4.6°C	none
12/2/08	2	acceptable	Temp not taken, but plenty of well frozen blue ice was present in the cooler

QA/QC DATA QUALITY OBJECTIVES:

	Reference Method	Range of Recovery	SRM/OPR Accuracy	Relative Precision	Achieved Detection Limit
Total Hg	EPA 7473 CVAA	80-120%	≤20%	≤20%	0.00199 µg/g

METHOD: Fourteen wet samples were analyzed for total mercury by EPA Method 7473 (Thermal Decomposition, Amalgamation, and Cold Vapor Atomic Spectrophotometry). Samples were collected on 11/17/08. Samples were analyzed on 12/2/08, which is within the EPA holding time of 180 days. All samples were stored at 4±2°C until analysis. Samples were analyzed on a wet weight basis and results were converted to a dry weight basis using % dry weight values determined by oven drying the samples at 103-105°C until constant weight is achieved.

BLANKS: Three method blanks were analyzed with each analytical batch of total Hg. Total Hg was not detected in any of the blanks at a concentration greater than the achieved the detection limit. None of the data were blank corrected.

BLANK SPIKES (OPR/LCS): Two ongoing precision and recovery (OPR) samples were analyzed with each analytical batch of samples for total Hg. All recoveries were within the criteria limits specified in the table above.

MATRIX SPIKES: One matrix spike/matrix spike duplicate pair was analyzed for total Hg. All recoveries were within the criteria limits specified above. The RPD on the MS/MSD pair was within the method acceptance criteria for precision.

QA/QC SUMMARY

REPLICATES: One sample was analyzed in duplicate for total Hg. Precision is reported by calculating the relative standard deviation (RSD) of replicate results. The RSD was within the method acceptance criteria limits listed above.

SRM: One sample of the standard reference material IAEA-405 was analyzed with the batch of samples for total Hg. The recovery was within the criteria limits listed above.

QA/QC SUMMARY

PROJECT:	NewFields Juneau		
PARAMETER:	Total and Methyl Mercury		
LABORATORY:	Battelle Sequim		
MATRIX:	Pore Water		
SAMPLE CUSTODY:	Fourteen sediment samples were received between 12/1/08 and 12/2/08. The samples were centrifuged and filtered to extract the pore water. The samples were preserved upon completion of filtration. Three of the samples did not produce any pore water. The 11 pore water samples were assigned a central file number (2974) and entered into Battelle's sample log-in system. After preservation, all samples were stored at room temperature in the dark.		
Sample Receipt Date	Number of Samples	Cooler Temperature	Comments
12/1/08	12	3.8°C, 4.6°C	none
12/2/08	2	acceptable	Temp not taken, but plenty of well frozen blue ice was present in the cooler

QA/QC DATA QUALITY OBJECTIVES:

	Reference Method	Range of Recovery	SRM/OPR Accuracy	Relative Precision	Achieved Detection Limit
Total Hg	1631 CVAF	71-125%	≤23%	≤21%	0.154 ng/L
Methyl Hg	1630 CVAF	65-135%	≤33%	≤35%	0.0100 ng/L

METHOD:

All pore water samples were digested for total mercury by subjecting them to bromine monochloride oxidation for a minimum 24 hours. Samples were analyzed by EPA Method 1631e on 12/9/08, which is within the holding time of 90 days. Mercuric ions in the oxidized sample were reduced to Hg⁰ with SnCl₂, and then purged onto gold-coated sand traps as a means of preconcentration and interference removal. Mercury vapor was thermally desorbed to a second "analytical" gold trap, and from that into a fluorescence cell. Fluorescence (peak area) is proportional to the quantity of mercury collected, which is quantified using an average response factor as a function of the quantity of sample purged.

All pore water samples were distilled by the method of Horvat, et al., 1993 for methyl mercury. Samples were analyzed by EPA Method 1630 on 12/12/08, which is within the holding time of 180 days. Methylmercury in the distilled sample was ethylated and then purged onto carbon traps as a means of preconcentration and interference removal. The ethylated methylmercury was thermally desorbed into a fluorescence cell. Fluorescence (peak area) is proportional to the quantity of methylmercury collected, which is quantified using an average response factor as a function of the quantity of sample purged.

QA/QC SUMMARY

PROJECT: NewFields Juneau
PARAMETER: AVS/SEM
LABORATORY: Battelle/Marine Sciences Laboratory, Sequim, Washington
MATRIX: Sediment

SAMPLE CUSTODY: Fourteen sediment samples were received between 12/1/08 and 12/2/08 for AVS/SEM analysis. The containers were received in good condition at $4\pm 2^{\circ}\text{C}$, which is appropriate for samples for AVS/SEM analysis (note that the temperature was not recorded on the 12/2 cooler, but there was still plenty of well-frozen blue ice present in the cooler). All of the samples were stored at $4\pm 2^{\circ}\text{C}$ and analyzed within 24 hours of receipt.

QA/QC DATA QUALITY OBJECTIVES:

<u>Analyte</u>	<u>Analytical Method</u>	<u>Range of Recovery</u>	<u>Relative Precision</u>	<u>Achieved Detection Limit ($\mu\text{mole/g}$)</u>
AVS	Allen, et al., 1991	75-125%	$\pm 25\%$	0.0927
SEM Cadmium	ICP-MS (EPA 1638m)	75-125%	$\pm 25\%$	0.0000998
SEM Copper	ICP-MS (EPA 1638m)	75-125%	$\pm 25\%$	0.000618
SEM Nickel	ICP-MS (EPA 1638m)	75-125%	$\pm 25\%$	0.000774
SEM Lead	ICP-MS (EPA 1638m)	75-125%	$\pm 25\%$	0.0000541
SEM Zinc	ICP-MS (EPA 1638m)	75-125%	$\pm 25\%$	0.00120
SEM Mercury	CVAF (EPA 1631e)	75-125%	$\pm 25\%$	0.000000431

HOLDING TIMES: All extractions and analyses were conducted within target holding times of 14 days for AVS, 90 days for SEM mercury, and 6 months for SEM metals.

DETECTION LIMITS: Achieved detection limits were determined by a previously conducted MDL study where replicates were analyzed and the standard deviation was multiplied by the Student's-t value for the number of replicates.

BLANKS Analytical blanks were determined for all analytes. No AVS was detected in the blank at a concentration greater than the MDL. Trace amounts of SEM analytes were detected in the blanks, but at a concentration well below the sample concentrations. Sample concentrations within 3x MDL were J-flagged and should be considered estimates. All SEM data were blank corrected.

BLANK SPIKES: Blanks were spiked for AVS. All blank spike recoveries were within the target range of 75%-125%. A low level standard was used as a blank spike for SEM metals analyzed by ICP-MS. All recoveries were within the target range of 75%-125%. Ongoing precision samples (OPRs) were analyzed with each analytical batch of Hg SEM. All recoveries met the criteria of 71% - 123%.

MATRIX SPIKES: Matrix spikes were prepared for all SEM metals. Recoveries of all analytes were within the data quality objectives of 75-125%.

QA/QC SUMMARY

REPLICATES:

Two analytical replicates were analyzed for AVS. This carries through to the SEM results and is designated "r1" and "r2" on the final report. Precision of replicate analyses is reported by calculating the relative percent difference (RPD) of replicate results. The RPD for the one of the two analytical replicates for AVS (26%) was just outside the quality criteria for precision, $\leq 25\%$, while the other pair was within the quality criteria for precision. The RPDs for the analytical replicates for the SEMs generated from the AVS replicate range from 0% to 35%. Only one replicate for Cd (27% RPD), both of which were detected at less than 10x the MDL, and one replicate for Cu (35% RPD) exceeded the data quality objective of $< 25\%$.

LCS/SRM SAMPLES:

A standard reference material (SRM) NIST 1641d or 1640 sample was analyzed for each SEM analyte. No SRM exists for AVS. All recoveries were within the data quality criteria for accuracy of 75-125%.

QA/QC SUMMARY

PROJECT: NewFields Juneau Tissues
PARAMETER: Total Mercury and Lipids
LABORATORY: Battelle/Marine Sciences Laboratory, Sequim, Washington
MATRIX: Tissue

SAMPLE CUSTODY: Eighty tissue samples were received on 2/10/09. All samples were received in good condition. Cooler temperature upon arrival was -4.6°C, which is within the temperature parameters set forth in the appendix to EPA Method 1631e for tissue samples. All samples were immediately freeze-dried and analyzed on a dry weight basis. Wet weight concentrations are calculated by multiplying the dry weight concentration by the % dry weight. All data have been reported on a wet weight (as received) basis.

QA/QC DATA QUALITY OBJECTIVES:

<u>Analyte</u>	<u>Analytical Method</u>	<u>Range of Recovery</u>	<u>Relative Precision</u>	<u>Achieved Detection Limit (µg/g ww or %)</u>
Mercury	CVAA (EPA 7473)	80-120%	±20%	0.000839
Lipids	Bligh-Dyer, 1959	NA	NA	0.05%

HOLDING TIMES: All analyses were conducted within the target holding time of 90 days for mercury and 6 months for lipids.

DETECTION LIMITS: Achieved detection limits were determined by a previously conducted MDL study where replicates were analyzed and the standard deviation was multiplied by the Student's-t value for the number of replicates.

BLANKS An analytical blank was determined for all analytes. No mercury or lipids were detected in any of the blanks.

BLANK SPIKES: Two blank spikes were prepared with each analytical batch for total Hg. Recoveries were within the data quality objectives listed in the table above.

MATRIX SPIKES: Two matrix spike/matrix spike duplicate pairs were prepared with each analytical batch for total Hg. Recoveries were within the data quality objectives listed in the table above.

REPLICATES: Four samples were analyzed in duplicate for total Hg and lipids. Precision is reported by calculating the relative percent difference (RPD) of replicate results. All RPDs were within the method acceptance criteria limits listed above.

LCS/SRM SAMPLES: A laboratory control sample (LCS) or standard reference material (SRM), in this case NRC DOLT-3, was prepared and analyzed in each analytical batch for total mercury. Recoveries were 99% to 103% of the known value, which meets the data quality criteria for accuracy. No SRM exists for lipids analysis.

QA/QC SUMMARY

BLANKS: Total Hg was not detected in any of the three method blanks at a concentration greater than the achieved detection limit. MeHg was not detected in any of the three method blanks at a concentration greater than the achieved detection limit. None of the data were blank corrected.

BLANK SPIKES (OPR/LCS): Two blank spike (OPR) samples were analyzed for each analyte. All recoveries were within the criteria limits specified in the table above.

MATRIX SPIKES: Two matrix spike/matrix spike duplicate pairs were analyzed for total Hg and MeHg. All recoveries were within the criteria limits specified above. The RPDs on the MS/MSD pairs were within the method acceptance criteria for precision.

REPLICATES: One sample was analyzed in duplicate for each analyte. Precision is reported by calculating the relative percent difference (RPD) of replicate results. The RPDs were within the method acceptance criteria limits for total mercury and MeHg.

SRM: One digested sample of the SRM 1641d, a spiked water, was analyzed. Recovery was 94% of the certified value for total Hg, which is within the criteria limits of 77-123%. Because no SRM for MeHg in water exists, a diluted sample of the tissue SRM DORM-2 was analyzed for MeHg. Recovery was 116% of the certified value for MeHg, which is within the criteria limits of 67-133% of the certified value.
